Monte Carlo Simulation - Introduction to Programming in Java

I'm a student in a Java Programming class. My problem deals with an interpretation of the Monte Carlo Simulation. I'm supposed to find the probability that three quarters or three pennies will be picked out of a purse that has 3 quarters and 3 pennies. Once a coin is picked it is not replaced. The probability should be 0.1XXXXXXX.

We can find PI using what is known a Monte Carlo method. The term Monte Carlo can be applied to a whole group of algorithms often in physical and mathematical systems. This one in particular uses the idea of a dartboard where a person simulates throwing a dart several times.

The Monte Carlo method computes this expected value by simulating a large number of scenarios and averaging the observed payoff of the bet over all scenarios. The simulation of the scenarios is best accomplished by a computer program. Computational power is becoming cheap and programming languages more powerful and more elegant.

Monte Carlo Simulations is a free software which uses Monte Carlo method (PERT based) to compute a project's time. You can add various activities and then estimate project time. To add activities, you can enter description, precedences, distributions (Uniform, Triangular, Beta, Gaussian, and Exponential), parameters, and critical path node.

In this article, we're going to explore the Monte Carlo Tree Search (MCTS) algorithm and its applications. We'll look at its phases in detail by implementing the game of Tic-Tac-Toe in Java . We'll design a general solution which could be used in many other practical applications, with minimal changes.
